Airbags

Your vehicle is equipped with four types of airbags: front airbags, front-seat knee airbags, side airbags, and side curtain airbags.

- **Front Airbags (SRS)**
  The front SRS airbags inflate in a moderate-to-severe frontal collision to help protect the head and chest of the driver and/or front passenger. They are housed in the center of the steering wheel for the driver and in the dashboard for the front passenger. Both airbags are marked SRS AIRBAG. SRS (Supplemental Restraint System) indicates that the airbags are designed to supplement seat belts, not replace them. Seat belts are the occupant’s primary restraint system.

- **Advanced Airbags**
  The front airbags have advanced features to help reduce the likelihood of airbag-related injuries to smaller occupants.

  The driver’s advanced airbag system includes a seat position sensor. Based on information from this sensor and the severity of the impact, the advanced airbag system determines the optimal deployment of the driver’s airbag.
The front passenger’s advanced airbag system has weight sensors. We advise against allowing a child age 12 or under to ride in the front passenger’s seat. However, if you do allow a child age 12 or under to ride in the front passenger’s seat, note that the system will automatically turn off the front passenger’s airbag if the sensors detect that the child is approximately 65 lbs (29 kg) or less.

For the advanced airbags to work properly:

- Do not spill any liquid on or under the seats.
- Do not put any object under the passenger’s seat.
- Make sure any objects are positioned properly on the floor. Improperly positioned objects can interfere with the advanced airbag sensors.
- All occupants should sit upright and wear their seat belts properly.
- Do not cover the passenger’s side dashboard with a cloth, towel, cover, etc.
- Make sure the floor mat behind the front passenger’s seat is hooked to the floor mat anchor. An improperly placed mat can interfere with the advanced airbag sensors.

- **Knee Airbags**
  Knee airbags help keep the driver and front passenger in the proper position during a moderate to severe frontal impact.

- **Side Airbags**
  The side airbags help protect the upper torso and pelvis of the driver or a front passenger during a moderate-to-severe side impact. They are housed in the outside edge of the driver’s and front passenger’s seat-backs. Both are marked **SIDE AIRBAG**.

- **Side Curtain Airbags**
  Side curtain airbags help protect the heads of the driver and passengers in the outer seating positions during a moderate-to-severe side impact. The side curtain airbags equipped in this vehicle are also designed to help reduce the likelihood of partial and complete ejection of vehicle occupants through side windows in crashes, particularly rollover crashes.
The side curtain airbags are located in the ceiling above the side windows on both sides of the vehicle.

The side curtain airbags are designed to deploy in a rollover or moderate-to-severe side impact. If the SRS control unit senses that your vehicle is about to roll over, it immediately deploys both side curtain airbags and activates both front seat belt tensioners. If the impact is on the passenger’s side, the passenger’s side curtain airbag will inflate even if there are no occupants on that side of the vehicle.

To get the best protection from the side curtain airbags, occupants should wear their seat belts properly, sit upright and well back in their seats.

Do not attach any objects to the side windows or roof pillars, as they can interfere with the proper operation of the side curtain airbags.

When side curtain airbags deploy in a frontal collision

One or both side curtain airbags may inflate in a moderate-to-severe angled frontal collision. In this case, the side curtain airbags will deploy slightly after the front airbags.

**Important Facts About Your Airbags**

Always wear your seat belt properly, sit upright and as far back from the steering wheel as possible, while allowing full control of the vehicle. A front passenger should move their seat as far back from the dashboard as possible.

**Do not place hard or sharp objects between yourself and a front airbag.** Carrying hard or sharp objects on your lap, or driving with a pipe or other sharp object in your mouth, can result in injuries if your front airbag inflates.

**Do not attach or place objects on the front airbag covers.** Objects on the covers marked SRS AIRBAG could interfere with the proper operation of the airbags or be propelled inside the vehicle and hurt someone if the airbags inflate.
Do not attach accessories on or near the side airbags. They can interfere with the proper operation of the airbags or hurt someone if an airbag inflates.

Do not attach any objects to the side windows or roof pillars. They can interfere with the proper operation of the side curtain airbags.

Do not cover or replace the front seat-back covers. This can prevent your side airbags from properly deploying during a side impact.

**WARNING**
An open glove box can cause serious injury to your passenger in a crash, even if the passenger is wearing the seat belt.
Always keep the glove box closed while driving.

- **Airbag System Indicators**
If a problem occurs in the airbag system, the SRS indicator comes on and a message appears on the driver information interface.

**SRS (Supplemental Restraint System) Indicator**
If the indicator comes on at any other time besides vehicle start-up or does not come on at all, have the system checked by a dealer as soon as possible. If you don’t, your airbags and seat belt tensioners may not work properly when they are needed.

**WARNING**
Ignoring the SRS indicator can result in serious injury or death if the airbag systems or tensioners do not work properly.
Have your vehicle checked by a dealer as soon as possible if the SRS indicator alerts you to a possible problem.

- **Passenger Airbag Off Indicator**
The indicator comes on to alert you that the front passenger’s front airbag has been turned off.
Passenger Airbag Off Indicator (continued)

This occurs when the front passenger’s weight sensors detect about 65 lbs (29 kg) or less (the weight of an infant or small child) on the seat. Infants and small children should always ride properly restrained in a back seat. If the front passenger’s seat is empty, the passenger’s front airbag will not deploy and the indicator will come on.

To ensure the passenger is detected properly, check that:

- There is no child seat or other object pressing against the rear of the seat-back.
- There is no rear passenger pushing or pulling on the back of the front passenger’s seat.
- The front seat or seat-back is not forced back against an object on the seat or floor behind it.
- There is no object placed under or beside the front passenger’s seat.
- The occupant is sitting in an upright position and the seat back is not excessively reclined.
- The occupant is not leaning against the door or center console.
- The occupant’s feet are placed on the floor in front of them.
- There are no objects hanging from the front passenger’s seat.
- Only small, lightweight objects are in the seat-back pocket.

The passenger airbag off indicator may come on and go off repeatedly if the total weight on the seat is near the airbag cutoff threshold.

Have your vehicle checked by a dealer as soon as possible if:

- All of the above conditions exist and the indicator comes on with an adult riding there.
- The seat is empty and the indicator is off.

Do not allow an adult passenger to ride in the front seat when the indicator is on.
1. Two SRS (Supplemental Restraint System) front airbags. The driver’s airbag is stored in the center of the steering wheel; the front passenger’s airbag is stored in the dashboard. Both are marked **SRS AIRBAG**.

2. Driver’s and front passenger’s knee airbags. The driver’s knee airbag is stored under the steering column. The front passenger’s knee airbag is stored under the glove box. Both are marked **SRS AIRBAG**.

3. Two side airbags, one for the driver and one for a front passenger. The airbags are stored in the outer edges of the seatbacks. Both are marked **SIDE AIRBAG**.

4. Two side curtain airbags, one for each side of the vehicle. The airbags are stored in the ceiling, above the side windows. The front and rear pillars are marked **SIDE CURTAIN AIRBAG**.

5. An electronic control unit that, when the vehicle is on, continually monitors information about the various impact sensors, seat and buckle sensors, rollover sensor, airbag activators, seat belt tensioners, and other vehicle information. During a crash event the unit can record such information.

6. Automatic front seat belt tensioners. In addition, the driver’s and front passenger’s seat belt buckles incorporate sensors that detect whether or not they are fastened.

7. A driver’s seat position sensor. If the seat is too far forward, the airbag will inflate with less force.

8. Weight sensors in the front passenger’s seat. The front passenger’s
SAFETY

airbag will be turned off if the weight on the seat is 65 lbs (29 kg) or less (the weight of an infant or small child).

9. Impact sensors that can detect a moderate-to-severe front or side impact.

10. An indicator on the dashboard that alerts you that the front passenger’s front airbag has been turned off.

11. An indicator on the instrument panel that alerts you to a possible problem with your airbag system or seat belt tensioners.

12. Safing Sensor

13. A rollover sensor that can detect if your vehicle is about to roll over and signal the control unit to deploy both side curtain airbags.

Airbag Care

You do not need to and should not perform any maintenance on or replace any airbag system components yourself. However, you should have your vehicle inspected by a dealer in the following situations:

When the airbags have deployed
If an airbag has inflated, the control unit and other related parts must be replaced. Similarly, once an automatic seat belt tensioner has been activated, it must be replaced.

When the vehicle has been in a moderate-to-severe collision
Even if the airbags did not inflate, have your dealer inspect the following: the driver’s seat position sensor, weight sensors in the passenger’s seat, front seat belt tensioners, and each seat belt that was worn during the crash.

Do not remove or modify a front seat without first consulting a dealer
This would likely disable the driver’s seat position sensor or the weight sensors in the passenger’s seat. If it is necessary to remove or modify a front seat to accommodate a person with disabilities, contact a Honda dealer. For U.S. vehicles, call Honda Automobile Customer Service at (800) 999-1009.

Child Safety

Each year, many children are injured or killed in vehicle crashes because they are either unrestrained or not properly restrained. In fact, vehicle collisions are the number one cause of death for children ages 12 and under.

The National Highway Traffic Safety Administration recommend that all children ages 12 and under be properly restrained in a rear seat. Some states have laws restricting where children
may ride.
To reduce the number of child deaths and injuries, every American state require that infants and children be properly restrained when they ride in a vehicle.

- **Protecting Child Passengers**
  - An inflating front or side airbag can injure or kill a child sitting in the front seat.
  - A child in the front seat is more likely to interfere with the driver’s ability to safely control the vehicle.
  - Statistics show that children of all sizes and ages are safer when they are properly restrained in a rear seat.
  - Any child who is too small to wear a seat belt correctly must be restrained in an approved child seat that is properly secured to the vehicle using either the lap belt portion of the lap/shoulder belt or the lower anchors of the LATCH system.
  - Never hold a child on your lap because it is impossible to protect them in the event of a collision.
  - Never put a seat belt over yourself and a child. During a crash, the belt would likely press deep into the child and cause serious or fatal injuries.
  - Never let two children use the same seat belt. Both children could be very seriously injured in a crash.
  - Do not allow children to operate the doors, windows, or seat adjustments.
  - Do not leave children in the vehicle unattended, especially in hot weather when the inside of the vehicle can get hot enough to kill them. They could also activate vehicle controls, causing it to move unexpectedly.

⚠️ **WARNING**
Children who are unrestrained or improperly restrained can be seriously injured or killed in a crash.

Any child too small for a seat belt should be properly restrained in a child seat. A larger child should be properly restrained with a seat belt, using a booster seat if necessary.

⚠️ **WARNING**
Allowing a child to play with a seat belt or wrap one around their neck can result in serious injury or death.
Instruct children not to play with any seat belt and make sure any unused seat belt a child can reach is buckled, fully retracted, and locked.
Protecting Infants

An infant must be properly restrained in a rear-facing, reclining child seat until the infant reaches the seat manufacturer's weight or height limit for the seat, and the infant is at least one year old. Many experts recommend use of a rear-facing seat for a child up to two years old if the child's height and weight are appropriate for a rear-facing seat.

Child seats must be placed and secured in a rear seating position. Rear-facing child seats should never be installed in a forward-facing position.

When properly installed, a rear-facing child seat may prevent the driver or a front passenger from moving their seat all the way back and/or from locking their seat-back in the desired position.

If this occurs, we recommend that you install the child seat directly behind the front passenger's seat, move the seat as far forward as needed, and leave it unoccupied. Or you may wish to get a smaller rear-facing child seat.

⚠️ WARNING

Placing a rear-facing child seat in the front seat can result in serious injury or death during a crash.

Always place a rear-facing child seat in the rear seat, not the front.

Protecting Smaller Children

If a child is at least one year old and within the weight range indicated by the child seat manufacturer, the child should be properly restrained in a firmly secured forward-facing child seat.

We strongly recommend placing a forward-facing child seat in a rear seating position.

Placing a forward-facing child seat in the front seat can be hazardous, even if the advanced front airbags automatically turn the passenger's front airbag off. A rear seat is the safest place for a child.
SAFETY

**WARNING**

Placing a forward-facing child seat in the front seat can result in serious injury or death if the front airbag inflates.

If you must place a forward-facing child seat in front, move the vehicle seat as far back as possible and properly restrain the child.

---

**Selecting a Child Seat**

Most child seats are LATCH-compatible (Lower Anchors and Tethers for Children). Some have a rigid-type connector, while others have a flexible-type connector. Both are equally easy to use. Some existing and previously owned child seats can only be installed using the seat belt. Whichever type you choose, follow the child seat manufacturer’s use and care instructions, as well as the instructions in this manual. Proper installation is key to maximizing your child’s safety.

In seating positions and vehicles not equipped with LATCH, a LATCH-compatible child seat can be installed using the seat belt and a top tether for added security. This is because all child seats are required to be designed so that they can be secured with a lap belt or the lap part of a lap/shoulder belt. In addition, the child seat manufacturer may advise that a seat belt be used to attach a LATCH-compatible seat once a child reaches a specified weight. Please read the child seat owner’s manual for proper installation instructions.

**Important considerations when selecting a child seat**

Make sure the child seat meets the following three requirements:

- The child seat is the correct type and size for the child.
- The child seat is the correct type for the seating position.

**Installing a LATCH-Compatible Child Seat**

A LATCH-compatible child seat can be installed in each of the second- and third-row seats except for the third-row center. A child seat is attached to the lower anchors with either the rigid or flexible type of connectors.

1. Locate the lower anchors under the marks.
2. To install a child seat in the second-row center seat*, remove the covers on each lower end of the seat-back by pulling on the handles. Place the child seat on the vehicle seat and attach the child seat to the lower anchors according to the instructions that came with the child seat.

Make sure that the lower anchors are not obstructed by the seat belt or any other object.

3. Raise the head restraint to its uppermost position, route the tether strap between the head restraint legs, and secure the tether strap hook onto the anchor.

4. Tighten the tether strap according to the seat manufacturer’s instructions.

5. Make sure the child seat is firmly secured by rocking it forward and back and side to side; little movement should be felt.

6. Make sure any unused seat belt that a child can reach is buckled, the lockable retractor is activated, and the belt is fully retracted and locked.
Installing a Child Seat with a Lap/Shoulder Seat Belt

1. Place the child seat on the vehicle seat.
2. Route the seat belt through the child seat according to the seat manufacturer’s instructions and insert the latch plate into the buckle. Insert the latch plate fully until it clicks.

3. Slowly pull the shoulder part of the belt all the way out until it stops. This activates the lockable retractor.

4. Let the seat belt completely wind up into the retractor, then try to pull it out to make sure the retractor is locked. If you are able to pull the shoulder belt out, the lockable retractor is not activated. Pull the seat belt all the way out and repeat steps 3 – 4.

5. Grab the shoulder part of the seat belt near the buckle and pull up to remove any slack from the lap part of the belt. When doing this, place your weight on the child seat and push it into the vehicle seat.

*if equipped
6. Make sure the child seat is firmly secured by rocking it forward and back and side to side; little movement should be felt.

7. Make sure any unused seat belt that a child can reach is buckled, the lockable retractor is activated, and the belt is fully retracted and locked.

   To deactivate a lockable retractor, release the buckle and allow the seat belt to wind up all the way.

**Adding Security with a Tether**

A tether anchorage point is provided behind each rear seating position. Regardless of whether it is installed with LATCH or a seat belt, a child seat that comes with a tether should use the tether for additional security.

1. Locate the appropriate tether anchorage point.

2. Raise the head restraint to its uppermost position, then route the tether strap through the head restraint legs. Make sure the strap is not twisted.

3. Secure the tether strap hook onto the anchor.

4. Tighten the tether strap according to the seat manufacturer’s instructions.
Protecting Larger Children

When a child is too big for a child seat, secure the child in a rear seat using the lap/shoulder seat belt.

Have the child sit upright and all the way back, then ensure the following:

- The child’s knees bend comfortably over the edge of the seat.
- The shoulder belt crosses between the child’s neck and arm.
- The lap part of the seat belt is as low as possible, touching the child’s thighs.
- The child can stay seated for the whole trip.

If a lap/shoulder belt cannot be used properly, position the child in a booster seat in a rear seating position. For the child’s safety, check that the child meets the booster seat manufacturer’s recommendations.

Some U.S. states require children to use a booster seat until they reach a given age or weight (e.g., 6 years or 60 lbs). Be sure to check current laws in the state or province/territory where you intend to drive.

**WARNING**

Allowing a child age 12 or under to sit in the front can result in injury or death if the passenger’s front airbag inflates.

If a larger child must ride in front, move the vehicle seat as far to the rear as possible, then have the child sit up properly and wear the seat belt properly, using a booster seat if needed.

*if equipped
